

☆☆☆ Day 126 ☆☆☆

of Our Daily UiPath Q&A Challenge!

Welcome to Day 126 of our exciting
UiPath Q&A Challenge! Each day,
we'll be answering one key question
to help you master UiPath and
revolutionize your automation
journey. 🚀

➡ Question for Today

How to Add and Update
Dependencies?

Adding and Updating Dependencies

To add dependencies to a project, install them from the Manage Packages window. Please note that the available packages differ based on the project compatibility. You can also install a package by adding one of the activities it contains to a project from the Available category of the Activities panel or Add activity search bar.

Whenever new versions are available for the current project dependencies, the Manage Packages button from the ribbon gets an update icon 

- To manage dependencies in a project, simply right-click on the Dependencies category in the Project panel, and then click on Manage. This opens the Manage Packages window, with the Project Dependencies category. The  icon shows which packages are currently installed.
- Default dependencies are displayed, together with the versions that are currently linked to the project. To update a package, simply click on the update  icon , next to the available version number. The  icon is shown next to the package, meaning that dependencies are ready to be installed.
- Dependencies are installed in the project only after you click Save. Simultaneously, the versions of dependencies are updated in the project.json file belonging to the project.
