🌟🌟🌟 Day 48 of Our Daily UiPath Q&A Challenge! 🌟🌟🌟

Welcome to Day 48 of our exciting UiPath Q&A Challenge! Each day, we'll be answering one key question to help you master UiPath and revolutionize your automation journey. 🚀

⛔ Question for Today

What is Machine Template?

A **machine template** enables you to **connect UiPath Robots** deployed on multiple host machines to Orchestrator, regardless the names of the host machines or the users logging onto them

Machine templates, as their name suggests, **work as templates** whose settings apply to **groups of host machines with the same physical setup**. When grouping host machines under the same machine template, you should follow below practices:

- the host machines have been deployed based on a shared template, or at least configured as if they were.
- the same applications should be installed on the machines, and quite importantly, the applications should be installed at the same paths on each of the machines, and they should all share the same version of the applications.
- the users logging into the applications on these machines should all have the same access rights to the applications on them.

Note : When a new Tenant is created, the system automatically creates a machine template with the name Shared. This name is reserved at the system level. You are not able to create a machine template with the name Shared.
